                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         pressure, epilepsy, Huntington's and Parkinson's disorder and eating, seizure, locomotor and anxiety disorders. They can also be used as targets for drug actions, and as basis for drug discovery and development. The NPY5 receptor may have an anti-epileptic activity in the control of limbic seizures. The present sequence is human chimeric NPY5GeltaY1IC3 receptor. The chimera comprises intracellular loop 3 of NPY5 receptor replaced with loop 3 of NPY5 receptor loop 3 of NPY5 receptor replaced with loop 3 of NPY5 receptor loop 3 of NPY5 receptor replaced with loop 3 of NPY5 receptor loop 3 of NPY5 rece
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to chimeric neuropeptide Y (NPY) receptor. The NPY receptors are G-protein-coupled transmembrane proteins with seven membrane spanning transmembrane (TM) domains. The compounds that modulate the activity of a NPY receptor is useful in the preparation of a medicament for treating conditions including obesity, high/low blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human chimeric

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                modulate the activity of a NPY receptor is useful in the preparation of a medicament for treating conditions including obesity, high/low blood pressure, epilepsy, Huntington's and Parkinson's disorder and eating, seizure, locomotor and anxiety disorders. They can also be used as targets for drug actions, and as basis for drug discovery and development. The NPY5 receptor may have an anti-epileptic activity in the control of limbic seizures. The present sequence is human chimeric NPY5deltaYIC3/deltaYIC7 receptor. The chimera comprises intracellular loop 3 and C-terminal intracellular domain of NPY5 receptor respectively, of NPY1 receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to chimeric neuropeptide Y (NPY) receptors The NPY receptors are 6-protein-coupled transmembrane proteins with seven membrane spanning transmembrane (TM) domains. The compounds that modulate the activity of a NPY receptor is useful in the preparation of

The recombinant chimeric receptor was produced in Sf9 cells using a baculovirus expression vector. It was used to assay the binding activity of compounds of the invention. Substituted spiro(isobenzofuran-1,4'-piperidin)-3-ones and 3H-spiroisobenzofuran-1,4'-piperidines capable of modulating NPY5 receptor activity are provided. Such compounds may be used to and are particularly useful in the treatment of avariety of interest activity useful in the treatment of avariety of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Bakthavatchalam R, Bl

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    В
                                                                                                                        Matches
                                                                                                                                                    Query Match
                                                                                                                                                                                                                                        modulate the activity of a NPY receptor is useful in the preparation of a medicament for treating conditions including obesity, high/low blood pressure, epilepsy, Huntington's and Parkinson's disorder and eating, seizure, locomotor and anxiety disorders. They can also be used as targets for drug actions, and as basis for drug discovery and development. The NPYS receptor may have an anti-epileptic activity in the control of limbic seizures. The present sequence is dog chimeric cnpy5deltacy11C3 receptor. The chimera comprises intracellular
                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to chimeric neuropeptide Y (NPY) receptors The NPY receptors are G-protein-coupled transmembrane proteins with seven membrane spanning transmembrane (TM) domains. The compounds that

                                                                                                                                                              The NPY receptors are G-protein coupled transmembrane proteins with seven membrane spanning transmembrane (TM) domains. The compounds that modulate the activity of a NPY receptor is useful in the preparation of a medicament for treating conditions including obesity, high/low blood pressure, epilepsy, Huntington's and Parkinson's disorder and eating, seizure, locomotor and anxiety disorders. They can also be used as targets for drug actions, and as basis for drug discovery and development. The NPY5 receptor may have an anti-epileptic activity in the control of limbic seizures. The present sequence is pig chimeric pNPY5deltapY1IC3 receptor. The chimera comprises intracellular loop 3 of NPY5 receptor replaced with intracellular loop 3 of NPY1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   WPI;
                                                                                                      Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New chimeric receptor proteins comprising a single polypeptide chain o amino acids, useful as targets for drug actions, and as basis for drug discovery and development -

    The present invention relates to chimeric neuropeptide Y (NPY) receptor The NPY receptors are 6-protein-coupled transmembrane proteins with seven membrane spanning transmembrane (TM) domains. The compounds that modulate the activity of a NPY receptor is useful in the preparation of a medicament for treating conditions including obesity, high/low blood pressure, epilepsy, Huntington's and Parkinson's disorder and eating, seizure, locomotor and anxiety disorders. They can also be used as targets for drug actions, and as basis for drug discovery and development. The NPY5 receptor may have an anti-epileptic activity in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     transmembrane; TM domain; therapy; obesity; blood pressure; ei

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           the control of limbic seizures. The present sequence is a dog chimeric cNPY5GeltacYICJ/GeltacYICT receptor. The chimera comprises intracellular loop 3 and C-terminal intracellular domain of NPY5 recept replaced with intracellular loop 3 and C-terminal intracellular domain respectively, of NPY1 receptor.
          discovery
                    New chimeric receptor proteins comprising a single polypeptide chain amino acids, useful as targets for drug actions, and as basis for drug actions.
                                                                                                                                                                                                                                                                     Neuropeptide Y; NPY receptor; G-protein-coupled transmembrane transmembrane; TM domain; therapy; obesity; blood pressure; eithuntington's disorder; Parkinson's disorder; eating disorder; locomotor; anxiety disorder; limbic seizure; tranquilliser; rat; chimeric receptor.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The NPY receptors are G-protein-coupled transmembrane proteins with seven membrane spanning transmembrane (TM) domains. The compounds that modulate the activity of a NPY receptor is useful in the preparation of a medicament for treating conditions including obesity, high/low blood pressure, epilepsy, Huntington's and Parkinson's disorder and eating, seizure, locomotor and anxiety disorders. They can also be used as targets for drug actions, and as basis for drug discovery and development. The NPY5 receptor may have an anti-epileptic activity in the control of limbic seizures. The present sequence is rat chimeric rNPy5deltarYIIC3 receptor. The chimera comprises intracellular loop 3 of NPY5 receptor replaced with intracellular loop 3 of NPY1

The receptor belongs to the G protein-coupled receptor superfamily. It is encoded by a cDNA clone (see also AAT30433) that was isolated from a hippocampus cDN library using rat Y5 receptor cDNA as probe. Recombinant rat Y5 receptor can be produced in prokaryotic or eukaryotic (e.g. COS, 293 or Sf9 insect) host cells. It is used to identify Y5 ligands
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Modifying increases

The specification relates to a method of treatment and prophylaxis of disorders and diseases associated with with NPY receptor subtype Y5 comprising administering to a warm-blooded animal, including man, in need of such treatment a therapeutically effective amount of a new heteroaryl compound. These disorders and diseases include e.g. eating disorders, believe the properties of disorders, diabetes, dyslipidaemia, hypertension, memory loss, epileptic seizures, migraine, sleep disturbance, pain, sexual/reproductive disorders, depression, anxiety, cerebral haemorrhage, shock, congestive heart

                                                                                                                                                                                                                                                                                                                                                                                                                                                                              can be used to treat obesity and activators can be used to treat anorexia. Antagonists capable of alleviating (by decreasing the activity of Y5-R) an abnormality can be identified by administering a potential antagonist to a transgenic mammal as above, and determining whether the substance alleviates the physical and behavioural abnormalities displayed by the transgenic mammal as a result of overactivity of a Y5-R. Agonists can be identified in a similar manner, but where the abnormality is alleviated by increasing the activity of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Y5-r can be used in processes to determine whether a chemical compound specifically binds to and activates or inhibits a Y5-R by measuring a second messenger response. The chemical compounds can be used to increase or reduce the activity of a Y5-R. In particular, inhibitors

The present sequence represents the human hippocampal Y5 receptor. The Y receptor is a G-protein coupled neuropeptide Y receptor found throughout the mammalian nervous system and is a powerful stimulant of feeding behaviour. Cells expressing DNA encoding the Y5 receptor can be used to determine whether a ligand specifically binds to a Y5 receptor. These cells or a cell extract, is exposed to the ligand and then any binding between the ligand and the receptor can be detected. The cells can also be used to determine whether a ligand is a Y5 receptor antagonist or agonist. The binding of chemical compounds to a Y5 receptor can also determined and whether they activate or inhibit the activation of the Y5 receptor can also be determined using cells expressing the receptor. The effect of drugs on the Y5 receptor and whether they act as agonists or a y5 receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Nucleic acid encoding

The NPY5 receptor may have an anti-epileptic activity in the control of limbic seizures. The present sequence is human NPY5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The NPY receptors are G-protein-coupled transmembrane proteins with seven membrane spanning transmembrane (TM) domains. The compounds that modulate the activity of a NPY receptor is useful in the preparation of a medicament for treating conditions including obesity, high/low blood pressure, epilepsy, Huntington's and Parkinson's disorder and eating, seizure, locomotor and anxiety disorders. They can also be used as targets for drive actions.

In an example from the invention, chimeric receptors including human NPY5 receptor sequences were constructed, and used to assay the binding activity of compounds of the invention. Substituted spiro(isobenzofuran-1,4'-piperidin)-3-ones and 3H-spiroisobenzofuran-1,4'-piperidines capable of modulating receptor activity are provided. Such compounds may be used t modulate ligand binding to NPY5 receptors in vivo or in vitro and are particularly useful in the treatment of a variety of disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    disorders, e.g. eating disorders such as obesity or bulimia, psychiatric disorders, diabetes and cardiovascular disorders such as hypertension, in humans and animals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Bakthavatchalam R,

                                                                                                                                                                              The NPY receptors are G-protein-coupled transmembrane proteins with seven membrane spanning transmembrane (TM) domains. The compounds that modulate the activity of a NPY receptor is useful in the preparation of a medicament for treating conditions including obseity, high/low blood pressure, epilepsy, Huntington's and Parkinson's disorder and eating, seizure, locomotor and anxiety disorders. They can also be used as targets for drug actions, and as basis for drug discovery and development. The NPYS receptor may have an anti-epileptic activity in the control of limbic seizures. The present sequence is african green

Scoring table: Gapop 10.0 , Gapext 0.5 BLOSUM62

Searched:

Total number of hits satisfying chosen parameters: 112892

112892 seqs, 41476328 residues

Minimum DB seq length: 0
Maximum DB seq length: 2000000000

Post-processing: Minimum Match 0% Maximum Match 100% Listing first 45 summaries

SwissProt_40:*

Database :

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
